Running Windows Applications with *Wine*

Installing Wine

Add the following to the Synaptic Package Manager. (We will cover this at the SIG. I put it in here so you won't have to write it down.)

```
deb HTTP://wine.sourceforge.net/apt binary/
```

This will add the wine site to the list of repositories that Ubuntu searches for updates and simplify installing wine.

Wine commands

wine	run a Windows application.
winefile	Explorer like file manager.
winecfg	configure wine.
uninstaller	remove Windows applications
wine control	Windows-like control panel

To make it easier to run Windows applications, create a launcher for *winfile*.

Installing *Adobe Acrobat*
